

Chemische Beständigkeit PE-Rohre

Die nachfolgende Tabelle gibt einen allgemeinen Überblick über die Beständigkeit von Polyethylen gegenüber verschiedenen chemischen Stoffen. Die bei der Beurteilung im Einzelfall zu berücksichtigenden Faktoren, die die Beständigkeit beeinflussen, sind insbesondere die Temperatur, die Kontaktzeit von Medium und Rohr, der Druck und die Wanddicke des Rohres. Eine zusammengefasste Klassifikationstafel für chemische Beständigkeit ist ferner der ISO/TR 10358 zu entnehmen.

Legende:

| | |
|----|--|
| ++ | kein Effekt |
| + | unter Einschränkungen geeignet |
| o | Eignung zweifelhaft |
| - | ungeeignet |
| V | ungeeignet aufgrund entflammbarer, giftiger oder unangenehmer Dämpfe |

| Chemische Substanz | Beständigkeit chemischer Angriff | | Beständigkeit mechanischer Angriff | Permeation | | Empfehlung |
|---------------------------------|----------------------------------|--------|------------------------------------|------------|--------|-------------------------|
| | +20 °C | +60 °C | | +40 °C | +60 °C | |
